Abstract (en)
[origin: WO2019234058A1] A holding apparatus (1) for fastening a laser device (10) to a preexisting ceiling or wall structure on site, more particularly to a roof slope, is described, said holding apparatus comprising at least one fastening unit (2), by means of which the holding apparatus (1) is securable to the ceiling or wall structure, at least one mounting rail unit (3) that is securely connected to the fastening unit (2), and a receiver unit (4), disposed on the mounting rail unit (3), for receiving the laser device in retentive fashion. In particular, the holding apparatus (1) is distinguished in that the fastening unit (2) has a rail-like embodiment and extends lengthwise along a first transverse axis (QA1) and in that the mounting rail unit (3) extends along a principal axis (HA) oriented substantially perpendicular to the first transverse axis (QA). The adjustably embodied receiver unit (4) comprises a receiver area (4.1) and is configured to allow the at least one receiver area (4.1) of the receiver unit (4) to be tilted relative to the mounting rail unit (3).
