Abstract (en)

[origin: WO2019234232A2] The invention relates to a method for correcting amplitude sub-estimates in time series which have been measured on sequences of multidimensional signals, wherein the multidimensional signals have been scanned using one or more integrated sensors, so that the time series are degraded by a centre of gravity which can be characterized by a duty cycle of the integrating sensors. According to the invention, a centre of gravity of the time series is corrected based on the duty cycle, the degree of utilization or the integration time of the sensors.
