Abstract (en)
[origin: WO2019246066A1] Production of nutrient-rich media, from an initial minimal medium, the rich media being suitable for cultivating heterotrophic cells, is described. These methods employ gas fermentation of photoautotrophic and/or chemoautotrophic microbes, under chemoautotrophic conditions, using carbon in common industrial waste gases to feed the growing biomass. The microbes also transform some of the carbon into organic nutrients that are released into the minimal medium thereby enriching the minimal medium. In further methods the nutrient-rich medium is then used to cultivate heterotrophic cells.
