Abstract (en)

[origin: WO2019238263A1] Disclosed is a container-closing device (1) which has a housing (2) and comprises a housing portion (2a) that has means for the secure or detachably secure connection to a container (B), and at least one chamber (4), which near the housing portion (2a) is delimited by a breakable element (5), wherein said element (5) is designed as a breakable portion of the housing (2) or said element is a breakable element which is mounted on a wall portion of the housing (2) and joined thereto in a preferably media-tight manner, wherein the breakable element (5) is designed and disposed in such a way that the joining/closing of the container (B) to/with the container-closing device (1) and the breaking of the breakable element (5) occur at the same time /simultaneously such that the content of the chamber (4) can or does come into direct contact with the content of the container (B) as soon as the container (B) is closed by means of the container-closing device (1).
