Abstract (en)

[origin: WO2020038944A1] The invention relates to a method for detecting objects on systems, having the steps of: - providing a three-dimensional representation of the system, wherein the position and orientation of the representation and the system are known, and - capturing a first image and a second image of the system, the two images being captured from different positions above the system. The invention is characterized in that for a plurality of sections of the system, a respective comparison of the first and the second image is carried out using a parallax effect. If the images in a region surrounding the system match, an object is detected on the system. The invention additionally relates to a corresponding assembly.
