Abstract (en)

[origin: EP3811988A1] The present invention relates to a method of manufacturing a medical device. The medical device includes a case obtained by mating a first case portion and a second case portion to each other, the case having a housing space inside; an elastic membrane as an elastic member attached to the case and with which a first housing space covered by the first case portion and a second housing space covered by the second case portion are separated from each other; fixing parts provided at respective peripheries of the first case portion and the second case portion and at which the first case portion and the second case portion that are mated to each other are fixed to each other; holding surfaces provided at the respective peripheries of the first case portion and the second case portion and between which a peripheral edge of the elastic membrane is held; and a sealing part provided at the periphery of the first case portion or the second case portion on an inner side with respect to the fixing parts and that seals an entirety of the peripheral edge of the elastic membrane held between the holding surfaces. When fixing at the fixing parts and sealing by the sealing part are performed to assemble the first case portion and the second case portion together, an air gap produced between the sealing part and the fixing parts is depressurized or heated.
