Abstract (en)
[origin: MX2020011187A] The present invention relates to a cylinder lock comprising a cylinder casing and a cylinder core which is rotatably supported in the cylinder casing about a cylinder axis and which is secured by means of a circlip against movement. Axial relative to the cylinder casing, wherein the cylinder core has a keyhole for the introduction of an associated key, wherein the cylinder core can be rotated between a locked position and an open position by means of the inserted key and wherein the lock cylinder has a plurality of drums that can be activated by means of the associated key. In the lock cylinder according to the invention, it is provided that the circlip together with the cylinder housing forms a rotary stop to limit a rotational angle of the cylinder core to a predetermined rotational angle range.
