Abstract (en)

[origin: WO2020046686A1] Many corporations and other entities use software-defined datacenters (e.g., onpremises datacenters and/or public cloud datacenters) to host their networks. The providers of the software-defined datacenters typically provide various network security options, but some entities will want to incorporate existing third-party security services (or other services) into their hosted networks. Thus, techniques for more easily incorporating such services into virtual networks would be useful.
