Abstract (en)

[origin: EP3815901A1] There is provide a transfer apparatus in which a carrying action of a transfer material can be stabilized by reducing the number of times of step back of the transfer material and a transfer material can be effectively utilized without wasting. A plate cylinder 20 of a transfer part 2 has only one transfer face 22 and performs transfer once for one rotation of the plate cylinder 20, a control part 5 continuously repeats multiple times a transfer operation of one cycle at which transfer is performed multiple times by rotating the plate cylinder 20 any multiple times, while a transfer material 6 is continuously and forwardly carried, and controls a step back to carry the transfer material 6 backwardly, so that an area of the transfer material 6 to be used for a first transfer at next cycle comes to an area adjacent to and on the upstream side of an area in the carrying direction, which has been used for a first transfer at previous cycle, when performing transfer at the next cycle after finishing transfer at one cycle.
