Abstract (en)  
[origin: EP3594434A1] The present invention relates in one aspect to a key box comprising a first member and a second member, the first member and the second member together defining a secure space; wherein the second member is moveable with respect to the first member between a CLOSED position preventing access to the secure space and an OPEN position allowing access to the secure space; wherein the second member comprises side walls; wherein the first member comprises a lock mechanism; wherein the lock mechanism comprises a locking plate, the lock mechanism being adapted to rotate the locking plate about a rotation axis between a LOCK position and an UNLOCK position. The locking plate comprises a plurality of cams, each cam projecting in a different radial direction away from the rotation axis, wherein each of the cams is arranged to engage the second member at a corresponding engagement point on the side walls when the second member is in the CLOSED position and the locking plate is in the LOCK position.
