Abstract (en)

[origin: WO2021094316A1] The invention relates to a component (2), in particular for a stringed instrument, comprising at least one first region (4) and a second region (6) for transmitting acoustic waves between a first body and a second body, wherein the first region (4) and the second region (6) have the same material and are connected together in order to transmit acoustic waves between each other. According to the invention, the at least one first region (4) and the second region (6) have varying component densities such that at least one acoustic property of the transmitted acoustic waves is thereby adapted or adaptable.
