Abstract (en)
[origin: EP3823073A1] The present invention relates to a lithium secondary battery manufactured to a negative electrode free battery and having lithium metal formed on a negative electrode current collector by charge, and using an electrolyte including a sacrificial salt. The lithium secondary battery forms lithium metal while being blocked from the atmosphere, and thereby fundamentally improves an existing problem caused by high reactivity of lithium metal, and, by including a sacrificial salt in an electrolyte, reduces lithium consumption caused by an irreversible reaction of a negative electrode, which may prevent decline in the battery capacity and lifetime properties.
