Abstract (en)

[origin: WO2019177440A1] The invention relates to a system for assembling building blocks in the form of a kit intended for the construction of buildings. The construction of the walls of dwellings used to be carried out with one-piece or modular building blocks or terracotta bricks, the technical performance of which in terms of thermal insulation and acoustics left something to be desired. The need to add large amounts of starting materials combined with long turnaround times had a negative impact on the cost prices of constructions. The technical solution consists in replacing the building blocks or terracotta bricks with a selection of a sufficient and necessary number of modular blocks that are able to be fitted together both in the horizontal plane and the vertical plane in order to build the walls of dwellings and enclosure walls without using sealing mortar. The blocks of the technical solution form an inseparable unit and are able, by being combined with one another, to build walls while ensuring outstanding solidity, reliability in terms of thermal insulation and acoustics, and an unparalleled appearance. From now on, masonry has, for the construction of walls, a new technique and new materials of reliable and economic design.
