Abstract (en)

[origin: KR20200026698A] A refrigerator can have a housing having an interior space and a cooling cycle mechanism for cooling the interior space. The housing has a plurality of housing elements divided along a predetermined dividing surface. The plurality of housing elements can be detachably coupled so that individual end faces can face each other. A sealing mechanism forming an air layer is provided between both end faces so as to prevent air from coming in and out of the interior space through both end faces.
