Abstract (en)

The present invention belongs to the field medical devices, more precisely to the field of exercise devices and relates to a multi-purpose transportable device for training of muscle strength, postural balance and muscle flexibility in the human body. The device comprises:- a base plate comprising:- two rotating surfaces, wherein rotation is enabled by suitable bearings,- a locking mechanism for locking the position of rotating surfaces,- bottom attachment sites for attaching a fulcrum element for balance training,- side attachment sites for attaching a belt or elastic band for strength training,- the fulcrum element that may be a cylindrical element, a cylindrical element, composed of two half-cylindrical elements, or a half-spherical element, and/or- a set of belts and/or elastic bands with different levels of stiffness.The elements are used alone or in combination, and enable a span of exercises comparable to about 10 single-product solutions.
