Abstract (en)  
[origin: WO2020020785A1] The invention relates to an assembly comprising a container (1) having a nozzle (17) for discharging a substance contained in the container (1) and a cap (19) for covering the nozzle (17), wherein the container has a first connecting area (14), which can be connected to a corresponding second connecting area (25) of the cap (19), wherein the connecting areas (14, 25) are chosen in such a way that the connection of container (1) and cap (19) is at least partly made via a rotational movement of container (1) and cap (19) relative to each other, wherein the cap (19) has an internal space (20) surrounded by a jacket (22), which is open on one side to receive the nozzle (17), wherein the jacket (22) has a front side (21) on the open side thereof, and wherein the container (1) has a top site (12) pointing in the direction of the cap and having a top edge (11), wherein the connecting areas (14, 25) are chosen in such a way and the front side (21) is matched to the top site (12) and the top edge (11) thereof in such a way that as the container (1) and cap (19) are connected, the front side (21) comes into contact with the top side (12) in an intermediate position of the cap (19), and during a further rotational movement of container (1) and cap (19), the front side (21) is pressed against the top side (12) and finally the cap (19) comes into a second end position, wherein the front side (21) overcomes the top edge (11).
