Abstract (en)

[origin: WO2020043999A1] The present invention concerns a method and a tool for designing and validating a data flow system comprising a set of software and/or hardware actors (ai, aj) interconnected with each other by unidirectional communication channels (ci, cj), the tool comprising: - a modelling interface (11) configured to generate an instance of the system by specifying, in a formal manner, a real-time and reconfigurable data flow, the reconfiguration of the data flow being carried out dynamically by propagating reconfiguration data from one actor to another through the communication channels, - an analysis module (13) configured to prove a predetermined set of behavioral properties of the system by means of a static analysis of the instance, - a refinement interface (15) designed to allocate resources to the instance, thus establishing a configured instance, the allocation of resources being carried out in such a way that an implementation of the system complies with the configured instance, and - a conformity test module (17) configured to verify the conformity of the behaviour of an implementation of the system with respect to the configured instance.
