Abstract (en)
A solid-state lamp (10) for vehicles comprises: a housing (12) extending in a longitudinal direction (X12) between opposed electrically conductive end caps (14), with a light-permeable portion (16) of the housing between the end caps (14), a solid-state light source (18), e.g. a LED source (182), arranged at the light-permeable portion (16) of the housing (12), electrically-conductive support formations (22) between the end caps (14) and the light source (18), the support formations (22) being configured to support the light source (18) and to provide a power supply path between the end caps (14) through the light source (18). The lamp (10) comprises at least one spring-like element (100) having a length (L) in said longitudinal direction (X12) and being deformable to vary its length (L) in the longitudinal direction (X12) so as to be able to absorb deformation stresses caused by thermal cycles.
