Abstract (en)  
[origin: WO2020026055A1] A ski boot comprising a cuff (30) and a lower shell (10) mutually coupled to define a substantially rigid support structure (2) and a liner (90) defined to receive the foot of a user positionable inside the rigid support structure (2). The support structure (2) has a first end portion (4) and a second end portion (5) mutually slidable between at least one first initial position and at least one second operative position so as to vary the configuration of the ski boot. The ski boot further comprises a plurality of elements (50) for the connection of such end portions (4, 5) and a single lever (60) that can be manoeuvred by the user operatively connected with the connection elements (50) so that the action of the former (60) allows the displacement of said first and second end portions (4, 5) from the first initial position to the second operative position. The single actuation lever (60) is selectively actuatable by the user. Furthermore, the single actuation lever (60) and the connection elements (50) are mutually configured so that the single actuation lever (60) acts simultaneously on all connection elements (50) of said plurality.
