Abstract (en)
[origin: WO2021080606A1] A replaceable print apparatus component includes a logic circuitry package. The logic circuitry package includes a first interface to communicate with a print apparatus logic circuit, and a logic circuit. The logic circuit is configured to detect a first response provided by an other logic circuitry package of an other replaceable print apparatus component in response to a first command directed to the other replaceable print apparatus component by the print apparatus logic circuit. The logic circuit is also configured to receive, via the first interface, a second command by the print apparatus logic circuit, and transmit, via the first interface, a second response to the second command based on the detected first response.
