Abstract (en)

[origin: GB2575983A] Verifying user interactions in which User profiles are associated with mobile devices 12 having data network connection means 18 (e.g. a WiFi or mobile data connections) which may be subject to availability and not constantly available. The mobile devices also have short-range direct broadcast communication means 16 (e.g. Bluetooth (RTM) radios). The short-range direct broadcast communication means (e.g. Bluetooth Low Energy Beacon) does not rely on external infrastructure and therefore direct broadcast communication can be made between devices 12 as long as the devices are close enough together. A connection can be verified between two users who were physically in the same place (close proximity) at a later point in time (by external server (28, figure 2) matching records), whether or not the users' devices both had a current data network connection during a handshake. The ibeacon broadcast may be one-way communication and comprise a universally unique identifier UUID for each user profile. Each device in response to receiving a respective broadcast (22) displays a code (24) which is a combination of components of the user profile identifiers associated with both devices, if at least one device currently does not have a connection to a data network.
