Abstract (en)
[origin: WO2020035175A1] The invention relates to a method for monitoring valves, in particular valves of a fire-fighting system, comprising: capturing first sensor signals at a valve in an intact state by means of a sensor; teaching the monitoring by means of the first sensor signals captured at the valve in the intact state; capturing second sensor signals at the valve in an unknown state by means of the sensor; comparing the taught first sensor signals with the second sensor signals; and outputting a signal in the event of a deviation of the second sensor signals from the first sensor signals exceeding a limit value.
