Abstract (en)
[origin: WO2020084308A1] The invention relates to a sealing assembly for one or more cables located in a structure and in particular a structure in the form of a wind turbine, said apparatus known as cable hang off apparatus. The apparatus includes first and second housings and sealing means and engagement means which in combination allow a seal to be achieved at relatively high pressures between first and second sides of the structure in which the assembly is formed and, at the same time, ensures the required mechanical connection of the one or more cables with the assembly and hence the structure, with a channel formed by said housings which has no interfaces in the channel parallel to the path of the one or more cables and thereby provides and improved sealed assembly and protection for said cables.
