Abstract (en)

Method for installing a pitched roof on a building with two side walls (1), comprising (I) providing roof elements (3) which are arranged to be mounted on the sloping edge(s) (1a) of both side walls and which have a length and rigidity that is sufficient to be able to span the entire distance (d) between both side walls, and then (II) applying the ends (L, R) of the roof elements to the sloping edge(s) of both side walls. There are at least three types of roof elements, viz. a base roof element (3a), a middle roof element (3b) and a ridge roof element (3c), each comprising an insulating body covered with, for example, steel sheet. The roof elements have a profile shape on their long edges, whereby successive roof elements interlock, and are preferably already provided with solar panels before the roof elements are installed.
