Abstract (en)

Thermoelectric assembly for powering a plurality of electromagnetic valves of a cooking appliance, comprising a main current circuit comprising a thermocouple, a cable configured for electrically connecting said thermocouple with the corresponding electromagnetic valve, and a transistor (9) connected to the cable and configured for de-energizing the electromagnetic valve. The main current circuit comprises a connection module (20) comprising a power supply (10) connected to the transistor (9), the power supply (10) comprising input terminals (22, 23) configured for being connected to an external energy source, a rectifier (11), and a resistive block (14) connected between one of the input terminals (22, 23) and the rectifier (11), the resistive block (14) being configured for minimizing the current circulating through the power supply (10) to a value equivalent to the galvanic isolation.
