Abstract (en)

[origin: WO2020039343A1] A dispensing system of comestible cream (1) is described, comprising: a container of comestible cream (2) which in turn comprises: first chamber (3); a first opening (4) which is in communication with the first chamber (3); a second chamber (5) which is in communication with the first chamber (3); a dispensing conduit (6) which is in fluid communication with the outside and which communicates with the second chamber (5) for dispensing the comestible cream towards the outside. The container of comestible cream (2) comprises a first piston (7) which is slidable along the internal walls of the first chamber (3) in order to reduce the volume of the first chamber (3). The dispensing system of comestible cream (1) comprises a second piston (8) which is slidable along the internal walls of the second chamber (5) and is configured so that during an operating cycle: the activating of the second piston (8) from a first position (A) to a second position (B) determines a depression in the second chamber (5) which causes conveying of a first part of comestible cream into the second chamber (5) and the sliding of the first piston (7) along the internal walls of the first chamber (3); the activating of the second piston (8) from the second position (B) towards the first position (A) determines an overpressure in the second chamber (5) which causes dispensing towards the outside of a second part of comestible cream.
