Abstract (en)

[origin: WO2020046621A1] A method for creating a composite cable having at least one high-performance termination on at least one end. A high-performance termination is added to an end of a short synthetic tensile strength member. The strength of the tensile strength member and termination is then tested. Once tested satisfactorily, the short cable is spliced onto a long cable of the same type using prior art splicing techniques. The union of the short cable and the long cable creates a "composite" cable having a high-performance termination on at least one end. In most applications it is preferable to set the length of the short cable so that the Interwoven splice will exist at a desired location.
