Abstract (en)

[origin: WO2020047398A1] A chimeric oncolytic virus is described that includes a herpesvirus having a modified nucleic acid sequence, including a modification of the herpesvirus gamma (1)34.5 gene (γ 134.5) or a nucleic acid with at least about 70% homology to the γ 134.5 gene that reduces its expression; a second viral nucleic acid sequence encoding a PKR evasion protein that does not cause virulence; and a third nucleic acid sequence encoding a tumor-associated antigen. Methods of using the chimeric oncolytic virus to treat subjects having cancer, or to vaccinate subjects at risk of developing cancer, are also described.
