Abstract (en)
[origin: WO2020047567A1] The invention relates to a swivel joint (1) for movably connecting two beams of a work buck (14), wherein the swivel joint (1) has a first element (2) that is connectable to one of the beams (4), and a second element (3) that is connectable to the other beam (4), wherein the two elements (2, 3) are connected to at least one bolt (5) such that the two elements can rotate about an axis of rotation of the bolt (5) relative to one another. The aim of the invention is to increase robustness and to simplify operability. This aim is achieved, according to the invention, in that the two elements (2, 3) are connected to one another in a frictionally locking manner by means of an elastic deformation of at least one spring component such that a rotating of the first element (2) relative to the second element (3) requires a predetermined torque.
