Abstract (en)

[origin: WO2020048695A1] The invention relates to a method for operating a motor vehicle, which comprises: a drive assembly having an electric drive machine; a friction braking system; and an actuating element, the actuating element being movable, in particular continuously variably movable, between a first end state and a second end state, a position of the actuating element in the first end state corresponding to a percentage value of 0%, and a position of the actuating element in the second end state corresponding to a percentage value of 100%. An acceleration torque is specified for the motor vehicle when the position of the actuating element has a percentage value that is greater than a specified threshold value, and a deceleration torque is specified for the motor vehicle when the position of the actuating element has a percentage value that is less than the threshold value. According to the invention, the friction braking system is controlled in such a way that the friction braking system produces the specified deceleration torque at least partially, in particular completely.
