Abstract (en)

[origin: WO2020055932A2] Methods for neutralizing and/or removing human GM-CSF in a subject in need thereof, comprising administering to the subject CAR-T cells having a GM-CSF gene knockout (GM-CSFk/o CAR-T cells) are provided. Also provided are methods for GM-CSF gene inactivation or GM-CSF knockout (KO) in a cell comprising targeted genome editing or GM-CSF gene silencing. Methods for preventing/treating immunotherapy-related toxicity, comprising administering to the subject CAR-T cells having a GM-CSF gene inactivation or GM-CSF knockout (GM-CSFk/o CAR-T cells), wherein the GM-CSF gene is inactivated or knocked out and/or a recombinant GM-CSF antagonist are provided. Methods for reducing a level of a cytokine or chemokine other than GM-CSF in a subject having immunotherapy-related toxicity comprising administering to the subject a recombinant hGM-CSF antagonist are provided. Also provided are methods for treating or preventing immunotherapy-related toxicity in a subject, comprising administering to the subject chimeric antigen receptor-expressing T-cells (CAR-T cells), the CAR-T cells having a GM-CSF gene knockout (GM-CSFk/o CAR-T cells). Methods for preventing or reducing blood-brain barrier disruption in a subject treated with immunotherapy, the method comprising administering CAR-T cells having a GM-CSF gene knockout (GM-CSFk/o CAR-T cells) to the subject, also are provided.
