Abstract (en)
[origin: WO2020053052A1] The invention relates to a method for tightening a screw for fastening a construction panel to a support of the construction panel, in which the fastening screw is screwed through the construction panel and then through at least part of the support, characterized in that it comprises: - a monitoring of a change over time of a tightening torque (605) of the fastening screw, with determination of a first maximum torque value (610) and then of a second minimum torque value (620), and - after determination of the second minimum torque value (620), a stoppage of the tightening of the fastening screw for a torque value, termed stoppage value (640), corresponding to a third maximum torque value (630) or being determined after an occurrence of a third maximum torque value (630).
