Abstract (en)  
[origin: WO2020052897A1] A device (2) for connecting two tubular objects has a connection piece housing (4) and a sleeve-like element (6), said connection piece housing (4) having a sleeve portion (3) with an insertion opening (8) and with at least one radially continuous cut-out (26), said sleeve-like element (6) being complementary to the insertion opening (8) for insertion into said insertion opening (8), said sleeve portion (3) having at least one first engagement element (34) and said sleeve-like element (6) having at least one second engagement element (36), which mutually correspond in order to lock the sleeve-like element (6) in the sleeve portion (3) and which can be moved from an open relative position into a locked relative position. The device is characterised in that the sleeve-like element (6) has a display element (24) that: extends radially outwards from the sleeve-like element (6); in the open relative position projects through the at least one cut-out (26); and in the locked relative position is moved radially inwards and is completely covered by a component (28, 44) disposed in the cut-out (26).
