Abstract (en)
A rotatable sprinkler comprises a base (10) with a continuous curved surface and a rotation element (50) disposed rotatably and relatively to the base (10). The rotation element (50) has an outlet (51) that connects to a water source. A decorative unit (70) is disposed on a support (71), part of which is located on the rotation element (50) and the free end of which is in contact with the continuous curved surface of the base (10). Therefore, the decorative unit (70) may rotate relatively to the base (10), or move up and down when the free end of the support (71) is pressed against the continuous curved surface.
