Abstract (en)

A method of disarming a smart home security setting includes displaying a prompt page for instructing a user to proceed with facial image capture; capturing at least one face image of the user; allowing the user to enter a password only when an area ratio of captured face on the face image to a whole face is greater than a predetermined first threshold and an image quality of the face image is greater than a predetermined second threshold; and issuing a warning notification if identification according to the password fails.
