Abstract (en)

[origin: WO2020057982A1] The invention relates to a system for attaching to a bus bar (1), which extends along a longitudinal axis (L) and has a plurality of holding clips (2), which are designed to be fastened to the bus bar (1) at different positions along the longitudinal axis (L). The system further has two side profile parts (3, 4) which, when the system is attached to the bus bar (1), extend along the longitudinal axis (L) on two opposite sides of the bus bar (1). The side profile parts (3, 4) can be connected to the holding clips (2) by means of latching connections. By virtue of the two side profile parts (3, 4), the overall appearance of the arrangement formed in this manner can be advantageously affected. The holding clips (2) make for particularly easy handling during installation of the side profile parts (3, 4). Because two side profile parts (3, 4) are provided, air can circulate vertically between the two side profile parts (3, 4) to cool the bus bar (1).
