Abstract (en)

[origin: CN215664368U] The utility model relates to equipment for labeling a container. According to this, the label is transferred from an elastic suction pad arranged on a pallet running along a circular trajectory onto a container transported on a container turret, and the pallet at the same time swings in the direction of travel thereof and/or against the direction of travel, as the pallet swings in a pressing section of the circular trajectory in such a way that the pallet is pressed against the container turret. According to the utility model, the central axis of the support plate is substantially directed towards the central axis of the associated container, and the suction pad is excessively pressed onto the container such that the label can be pressed onto the container over a relatively large area and over a relatively long period of time and thus can be transferred to the container in a particularly reliable and high-quality manner.
