Abstract (en)
[origin: WO2020065389A2] In the baby bottle (2) intended for feeding infants, the rigid ring (6) is secured to the external face (9a) of the base of the skirt (7), the ring (6) is arranged in such a way that the opening or, respectively, the closing of the baby bottle (2) is performed by rotation through 90 degrees or less, the ring (6) comprises on its periphery at least two cutouts (6a, 6b) each providing access to a section (7a, 7b) of the base of the skirt through which there are formed two devices (13a, 13b) allowing air to be drawn into the baby bottle, the teat (3) further comprises at its upper end several orifices (3a, 3b, 3c, etc.) acting as milk ducts during suckling. The baby bottle (2) is most generally made up of a teat-ring as defined hereinabove, of a baby bottle body (14) and of a protective cap (15).
