Abstract (en)
[origin: WO2020064671A1] The invention relates to a sensor device (S) for determining a traction difference (18, 20) and a means and a method for controlling the traction of a, particularly rail-borne, train (100, 200, 300, 400) having at least two carriages (1, 2, 3, 4, 5) that are connected to each other, wherein adjacent carriages each are connected together by means of a carriage coupling arrangement (KA), comprising notably the step: determining at least one value of a parameter for a traction difference (18, 20) between the connected carriages at the carriage coupling arrangement (KA), particularly by means of a sensor device (S) on the carriage coupling arrangement (KA).
