Abstract (en)

[origin: US2020102142A1] A container for the shipment and display of a product includes a four-sided, corrugated sleeve that is selectively enclosed by a pair of opposing plastic trays. The inner surface of each tray includes an outer flange and an inner flange which together define a continuous peripheral groove which is dimensioned to fittingly receive either the open top end or the open bottom end of the sleeve during the assembly process. The continuous nature and depth of the peripheral groove simplifies the orientation of components during assembly and additionally minimizes the risk of any considerable bulging of the sleeve upon the loading of product therewithin. In its assembled state, the container adequately protects the product during shipment while maintaining adequate ventilation. Upon completion of shipment, the top tray and sleeve can be removed, leaving the product displayed on the bottom tray at the point-of-sale without any direct handling required.
