Abstract (en)

[origin: KR20200115002A] The present disclosure relates to a communication technique for fusing a 5th generation (5G) communication system with an Internet of things (IoT) technology to support a higher data transmission rate than that of a 4th generation (4G) system and a system thereof. The present disclosure can be applied to an intelligent service (for example, smart home, smart building, smart city, smart car or connected car, healthcare, digital education, retail business, security and safety related services, etc.) based on a 5G communication technology and an IoT-related technology. The present disclosure provides a method and apparatus for indicating an alternative resource at a collision of configured grants. According to the present disclosure, a control signal processing method in a wireless communication system comprises the steps of: receiving a first control signal transmitted from a base station; processing the first control signal received; and transmitting a second control signal generated based on the processing to the base station.
