Abstract (en)

[origin: EP3633108A1] In an assembly of concrete blocks for covering a dyke for protection against wave attacks, comprising at least two concrete blocks, each substantially having the form of a polygonal prism comprising a ground surface and a prism perimeter surface having a contiguous series of at least six side surfaces, in particular eight side surfaces, wherein the concrete blocks are placed at a distance from each other so as to form interstices between the blocks, at least two blocks are interconnected by means of a connecting beam integrally formed with said at least two blocks, said connecting beam having a ground surface that is aligned with the ground surface of said at least two blocks and having a height that corresponds to 50-80%, preferably 65-75%, of the height of said at least two blocks.
