Abstract (en)

[origin: WO2020083190A1] Sometimes during wireless communication a random access procedure needs to be performed. A two-step random access procedure is disclosed herein, which may help reduce latency and/or signaling overhead compared to a four-step random access procedure. Moreover, some problems relating to a two-step random access procedure have been recognized and are addressed in some embodiments, for example: how to indicate resources for the uplink grant; how to switch to a four-step random access procedure when necessary; and/or how to accommodate UEs that do not have the capability to perform a two-step random access procedure.
