Abstract (en)

The present invention provides a mechanism for a cosmetic container and a container including said mechanism. The mechanism includes a cup for receiving the cosmetic, a sleeve mounted around the cup, and a damping member which is elastically deformable, wherein the damping member is disposed on the cup and located between the cup and the sleeve, the damping member is in contact with an inner wall of the sleeve to generate a frictional resistance against the sleeve when the cup moves within the sleeve. During the movement of the cosmetic, the damping member generates a resistance through friction with the inner wall of the sleeve, thereby providing twisting force for the rotational movement, which facilitates the perception of the amount of lipstick being dispensed. Thus, it is easier for the user to adjust the lipstick to a suitable position, which improves the user experience.
