Abstract (en)
[origin: WO2020078979A1] The invention relates to a cylinder (2) which is designed to receive one or more hollow cylinders on an outer surface (12) of the cylinder (2). The cylinder (2) comprises at least one movable stop (1) having at least one movable element, wherein, in an idle position, the at least one movable element does not protrude beyond the outer surface (12) of the cylinder (2) and allows hollow cylinders to be slid over it, and in an active position protrudes beyond the outer surface (12) of the cylinder (2) and acts as a mechanical stop for hollow cylinders. According to the invention, the at least one movable element can be moved from the idle position to the active position and vice versa by means of a rotary motion. A further aspect of the invention relates to a method for positioning a hollow cylinder on a cylinder (2) of this kind.
