Abstract (en)

[origin: WO2020079192A1] Disclosed is a device (1) for collating and loading articles, comprising a container (2) which is open along its upper wall and has a front wall (2a) which is adjacent to two side walls (2b) and a lower wall (2c), one of these walls being movable and designed for loading the articles into a case, and further comprising a variable-geometry means for collating articles in the direction of a reference point zero (0), in the plane of the lower wall, in the orthonormal directions OX and OY, the articles being intended to change and amend their trajectories in the orthonormal directions OX and OY towards the reference point (0), depending on the amount of space they occupy.
