Abstract (en)
[origin: WO2020079468A1] This invention relates to a security sliding gate comprising a first (A) and a second gate part (B) which are slidably movable between an open position and a closed position and a locking device (20-26) for maintaining the gate parts (A),(B) in the closed position, the first gate part (A) comprising at least one first locking body (20-22) defining a first passage (20c-22c), at least one second locking body (23-25) defining a second passage (23c-25c) and a securing element (26), such that, when the gate parts (A), (B) are in the closed position, the first (20c-22c) and second passages (23c-25c) are aligned in a substantially vertical direction, allowing the securing element (26) to extend through said passages (20c-25c). The locking bodies preferably extend in the space (17) between the end sides (18),(19) of the respective gate parts (A),(B).
