Abstract (en)

[origin: WO2020079341A1] The invention relates to a light module comprising diodes, a reflector (30) comprising first and second elongated sections (31, 32) joined by a curved intermediate section (33), a first support plate (10) extending along the inner edge of the first section (31) and bearing a first series of diodes (40) capable of emitting light rays of a first colour, as well as a second support plate (20) extending along the outer edge of the second elongated section (32) and bearing a second series of diodes (50) capable of emitting light rays of a second colour, the first support plate comprising an extension (11) extending beyond the first elongated section (31) up to the second support plate so as to constitute a screen which limits or prevents parasitic reflections of light rays coming from the second series of diodes (50) on the curved intermediate section (33) and the first elongated section (31).
