Abstract (en)

A parquet (4) comprising at least one first strip (8) and one second strip (12), each having a body (16) extending along a prevailing longitudinal direction (L-L) and identifying a pair of bases (20) for the laying thereof, wherein said body (16) is provided, at at least one lateral edge (24), with a seat or perimeter recess (28), recessed with respect to said lateral edge (24), the lateral edges (24) of the adjacent strips (8,12) identifying a joint (32), at least one connection element (36) housed in the seats (28) of said first and second adjacent strips (8,12). The connection element (36) is deformable from a non-deformed or rest configuration, in which it is housed at least partially continuously in the seats (28) of said first and second strips (8,12) so as to create an undercut to a relative vertical movement between said strips (8,12), along a vertical direction (Z-Z) perpendicular to the prevailing longitudinal direction (L-L) and to said bases (20), to a deformed configuration in which the connection element (36) is housed in only one of said seats (28) or has a discontinuity or separation (40) at said joint (32) so as to allow the separation of said strips (8,12) in the vertical direction (Z-Z).
