Abstract (en)
[origin: WO2020049314A2] An oven with an enclosure defining an oven chamber for receiving food, a food supporting base at the bottom of the oven and a plurality of electrically powered heaters comprising one or more gas heaters in the roof of the oven and adjacent air nozzles configured to blow circulating heated humidity regulated air at the food from above with a high impingement velocity, one or more base heaters configured to heat the base, or a cooking container located on the base, and thereby regulate conductive heat transfer to the base of the food and one or more high temperature radiative heaters at the top of the oven temperature which direct radiation at the top surface of food in use. The oven has a cooking program, not requiring a preheating step, in which food is initially heated as quickly as possible, within an electrical power consumption limit, by convection and conduction and where power is later redirected from the gas heaters to the radiative heaters to continue to heat the food rapidly when convection becomes less effective. The program completes before the enclosure has reached steady state temperature. The product is high quality food, cooked quickly and with substantially reduced energy consumption.
